Introduction: Electroacoustic resonators employing surface acoustic waves (SAW) are commercially widely used in RF filters, low noise generators as well as various sensors. Here we present a specific COMSOL based approach towards the design of a specific class of SAW resonators, namely surface transvers weave resonators (STWR).

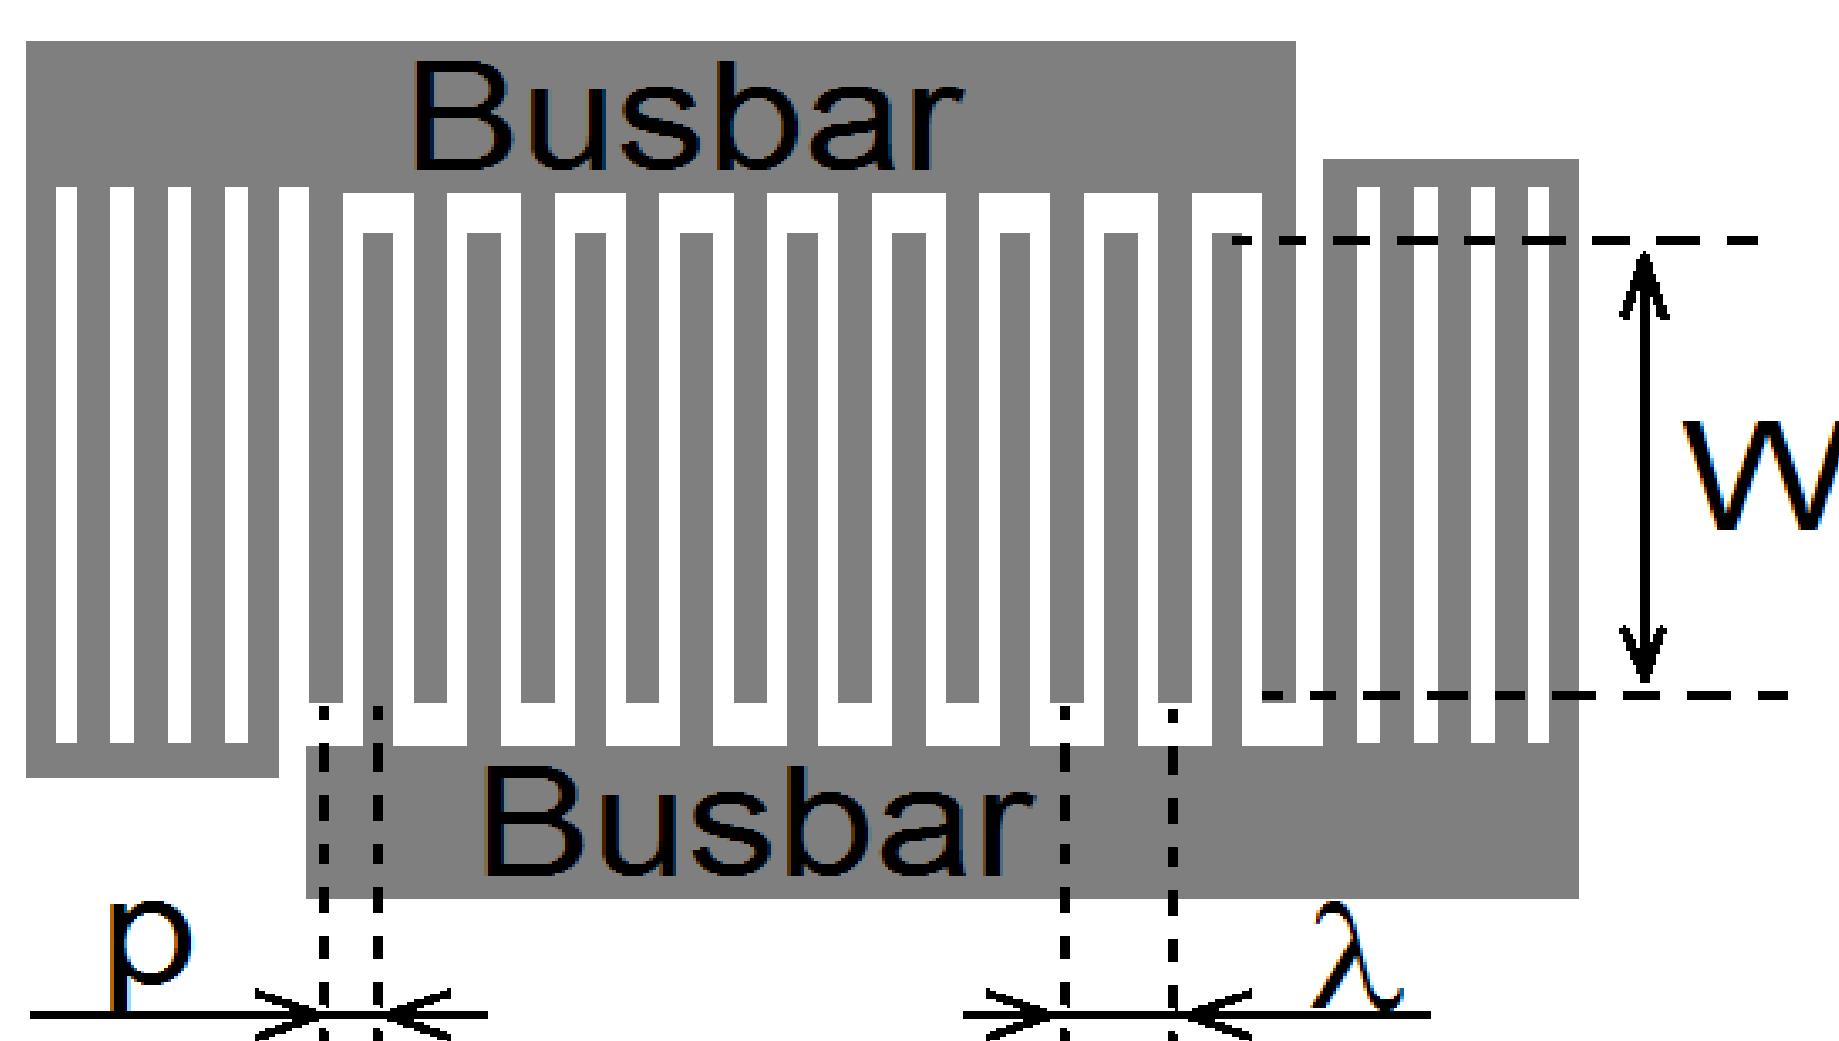

Figure 1. Sketch of a state of art SAW (STW) resonator

Computational Methods:

COMSOL – Structural Mechanics -
Piezoelectric Devices

Problems Solved:

- Eigenfrequency and Frequency Response analyses of a single wavelength cell.
- 2D Frequency Response analysis of finite STW Resonator
- Frequency Response analysis of STW 3D primitive cell, including busbar area

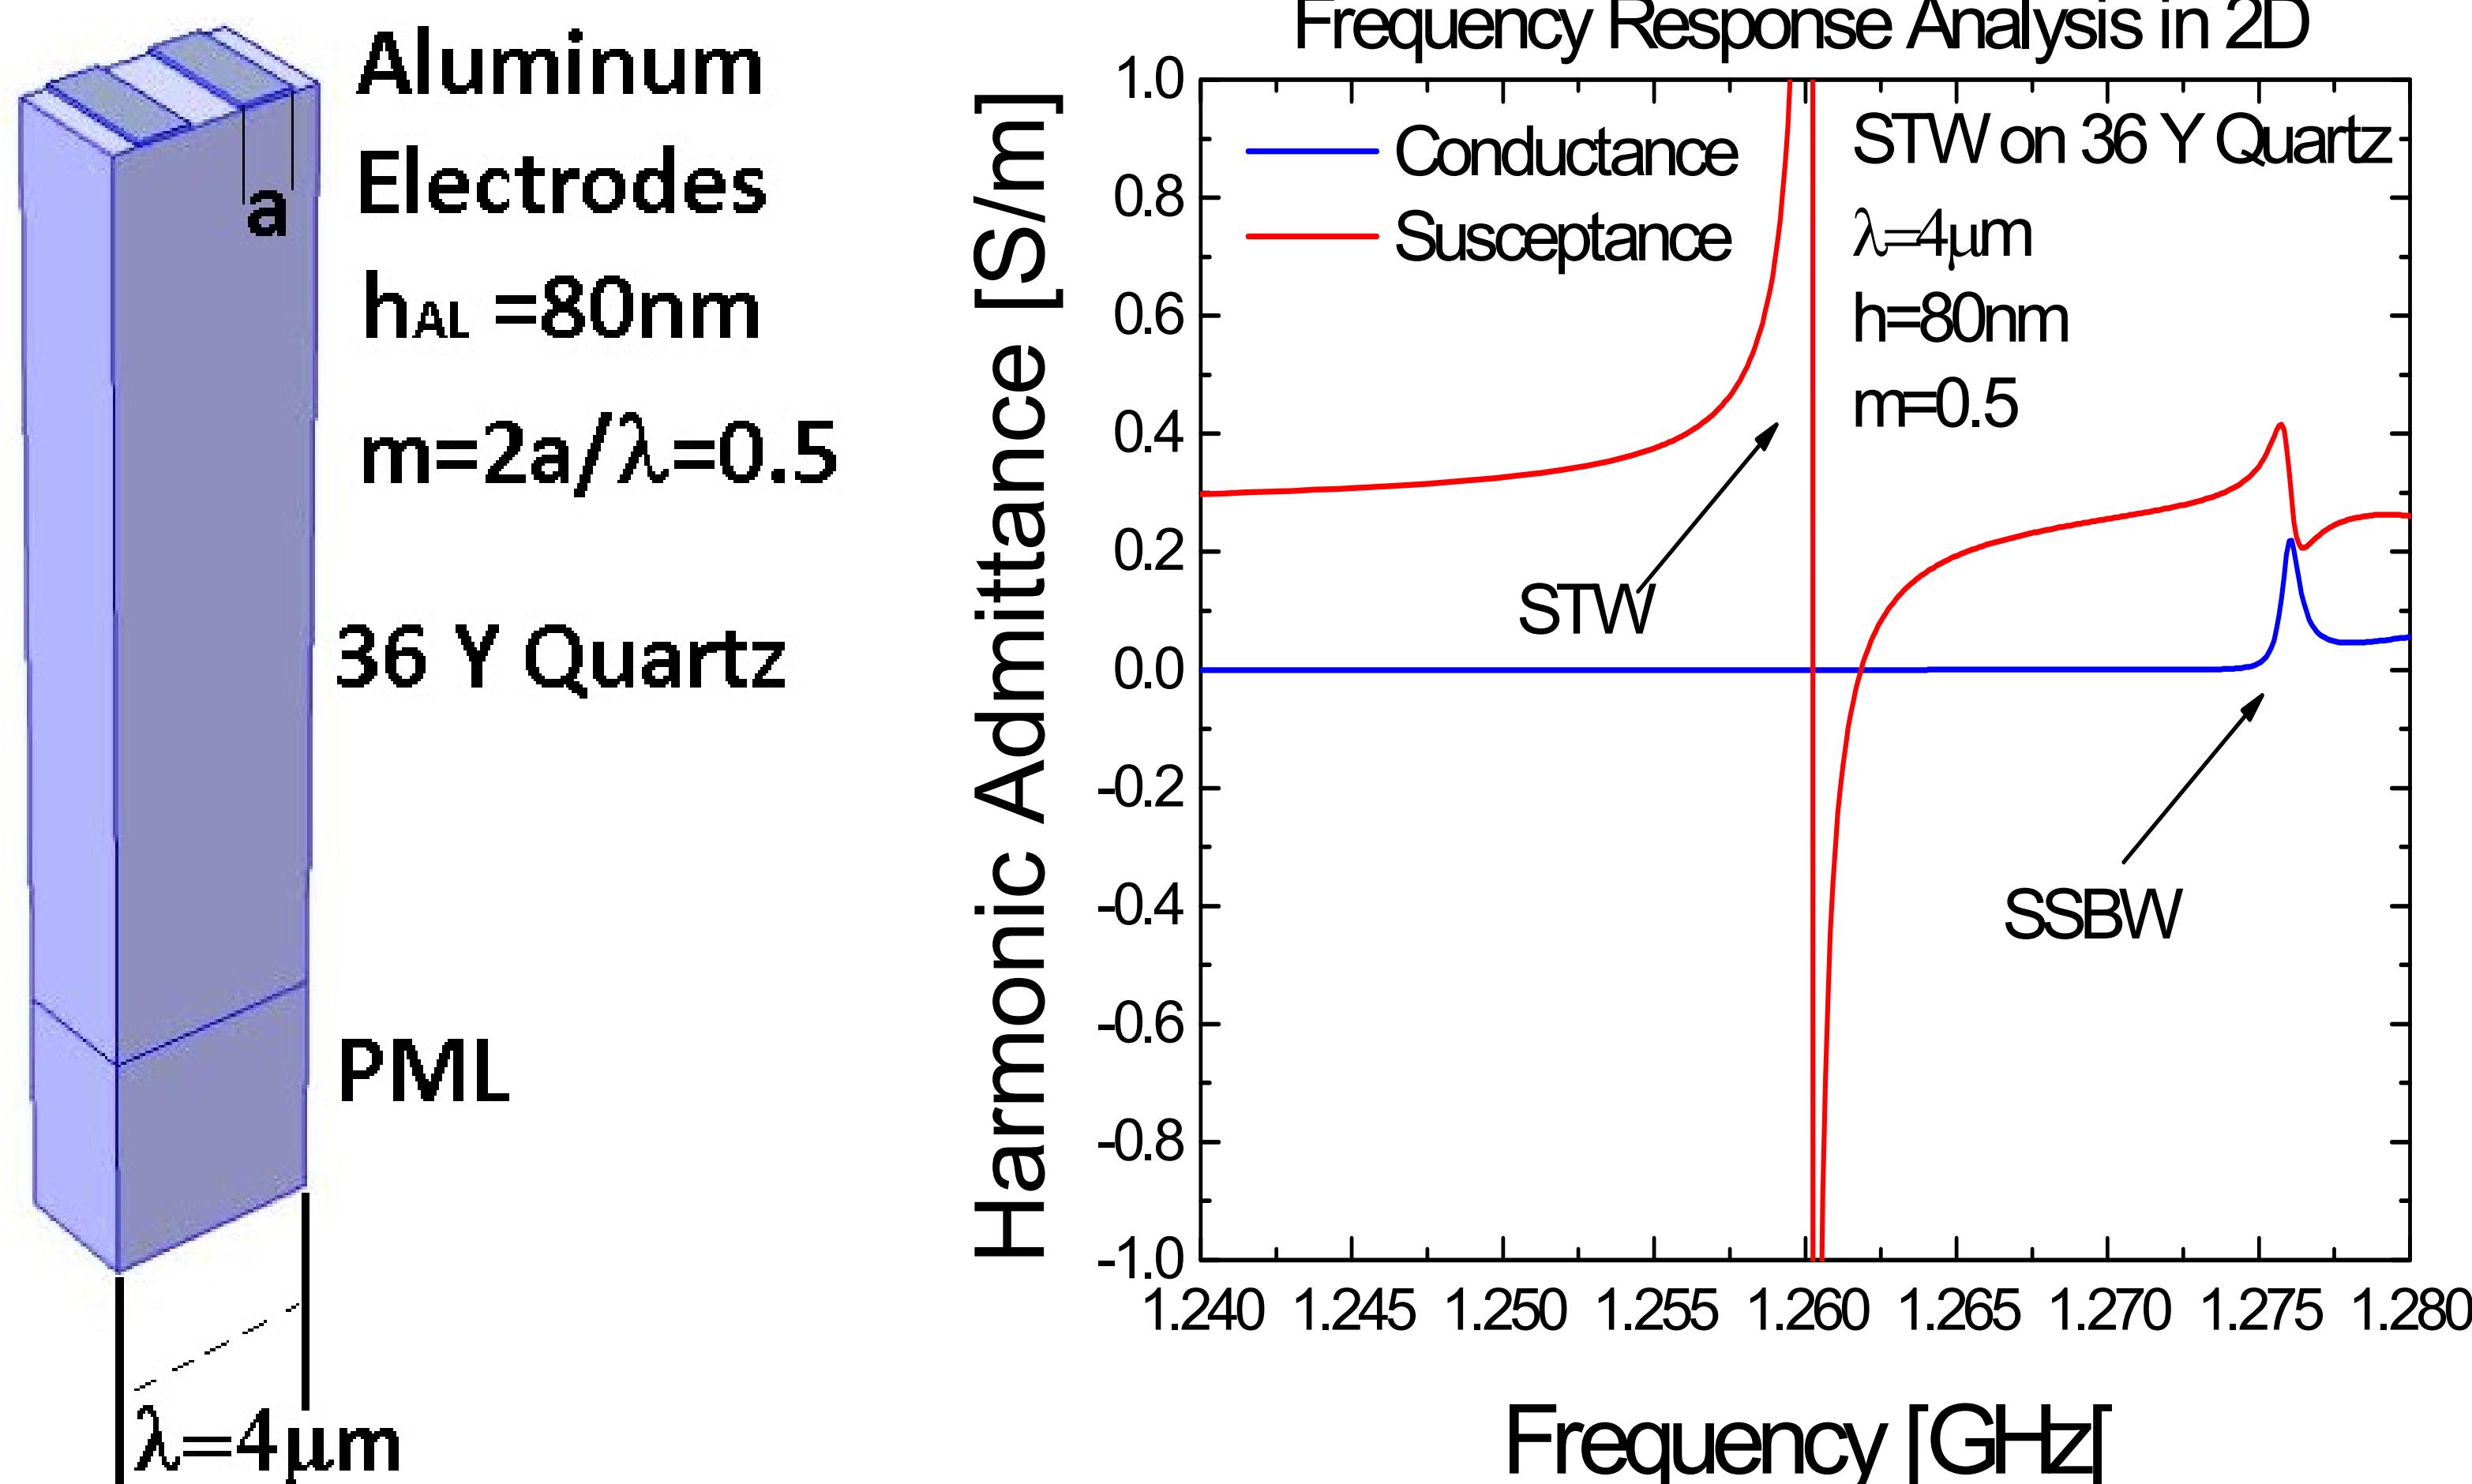

Figure 2. a) Primitive Cell b) Harmonic Admittance

Results: Two modes : STW and SSBW:
